Tree Plantation App - Final Defense Rubric Code

This document highlights the specific code implementations addressing the final defense rubrics for the Tree Plantation Management System.

---

1. Spring Security Integration (CO2)

Rubric: Enterprise Architecture / Security implementation. **Implementation:** A `SecurityConfig` class that configures in-memory authentication and protects backend routes.

```
// File: src/main/java/com/plantree/config/SecurityConfig.java
package com.plantree.config;

import org.springframework.context.annotation.Configuration;
import
org.springframework.security.config.annotation.authentication.builders.Authenticat
ionManagerBuilder;
import org.springframework.security.config.annotation.web.builders.HttpSecurity;
import
org.springframework.security.config.annotation.web.configuration.EnableWebSecurity
;
import
org.springframework.security.config.annotation.web.configuration.WebSecurityConfig
urerAdapter;

@Configuration
@EnableWebSecurity
public class SecurityConfig extends WebSecurityConfigurerAdapter {
    @Override
    protected void configure(AuthenticationManagerBuilder auth) throws Exception {
        auth.inMemoryAuthentication()
            .withUser("admin").password("{noop}admin123").roles("ADMIN");
    }

    @Override
    protected void configure(HttpSecurity http) throws Exception {
        http.csrf().disable()
            .authorizeRequests()
                .antMatchers("/admin.xhtml", "/admin/**",
"/api/**").authenticated()
                .anyRequest().permitAll()
            .and()
            .formLogin()
                .loginPage("/login.xhtml")
                .defaultSuccessUrl("/admin.xhtml", true)
                .permitAll()
            .and()
            .logout()
                .logoutSuccessUrl("/index.xhtml")
```

```
                    .permitAll();
    }
}
```

---

2. Custom Servlet Filter (CO2)

Rubric: Interceptor / Filter Pattern for Request Processing. **Implementation:** An `AuthFilter` that intercepts requests to sensitive endpoints, logs access timestamps, and redirects unauthenticated users.

```
// File: src/main/java/com/plantree/filter/AuthFilter.java
package com.plantree.filter;

import javax.servlet.*;
import javax.servlet.http.HttpServletRequest;
import javax.servlet.http.HttpServletResponse;
import java.io.IOException;
import java.util.Date;

public class AuthFilter implements Filter {
    @Override
    public void init(FilterConfig filterConfig) throws ServletException {
        System.out.println("[AuthFilter] Initialized.");
    }

    @Override
    public void doFilter(ServletRequest request, ServletResponse response,
FilterChain chain)
            throws IOException, ServletException {
        HttpServletRequest req = (HttpServletRequest) request;
        HttpServletResponse res = (HttpServletResponse) response;

        System.out.println("[AuthFilter] Request received at " + new Date() + "
for URL: " + req.getRequestURI());

        // Simple auth check fallback
        if (req.getSession().getAttribute("SPRING_SECURITY_CONTEXT") == null) {
            System.out.println("[AuthFilter] Unauthenticated access detected.
Redirecting to login...");
            res.sendRedirect(req.getContextPath() + "/login.xhtml");
            return;
        }
        chain.doFilter(request, response);
    }
}
```

---

3. RESTful API Endpoints (CO2)

Rubric: Implementation of Web Services / REST endpoints. **Implementation:** A Spring MVC `RestController` exposing application data as JSON.

```
// File: src/main/java/com/plantree/rest/PlantTreeRestController.java
package com.plantree.rest;

import com.treeplantation.dao.PlantationDriveDAO;
import com.treeplantation.model.PlantationDrive;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.web.bind.annotation.GetMapping;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RestController;
import java.util.List;

@RestController
@RequestMapping("/api")
public class PlantTreeRestController {
    @Autowired
    private PlantationDriveDAO driveDAO;

    @GetMapping(value = "/drives", produces = "application/json")
    public List<PlantationDrive> getAllDrives() {
        return driveDAO.getAllDrives();
    }
}
```

---

4. Multithreading / Concurrency (CO1, CO4)

Rubric: Multithreaded daemon service / Background tasks. **Implementation:** `WeatherSocketClient` uses `ScheduledExecutorService` to poll an external service on a background thread without blocking the main JSF UI.

```
// File: src/main/java/com/plantree/service/WeatherSocketClient.java
package com.plantree.service;

import org.springframework.stereotype.Service;
import javax.annotation.PostConstruct;
import javax.annotation.PreDestroy;
import java.util.concurrent.Executors;
import java.util.concurrent.ScheduledExecutorService;
import java.util.concurrent.TimeUnit;

@Service
public class WeatherSocketClient {
    private final ScheduledExecutorService executorService =
Executors.newSingleThreadScheduledExecutor();
    private volatile String latestWeatherAlert = "Loading weather data...";

    @PostConstruct
```

```
    public void init() {
        executorService.scheduleAtFixedRate(() -> {
            try {
                // Simulating network delay in background thread
                Thread.sleep(1500);
                latestWeatherAlert = "Clear Skies - Ideal for planting.";
                System.out.println("[Background Thread] Fetched Weather Alert: " +
latestWeatherAlert);
            } catch (InterruptedException e) {
                Thread.currentThread().interrupt();
            }
        }, 0, 5, TimeUnit.MINUTES);
    }

    public String fetchWeatherAlerts() {
        // Returns instantly without blocking the JSF frontend
        return latestWeatherAlert;
    }

    @PreDestroy
    public void cleanup() {
        executorService.shutdown();
    }
}
```

---

5. Advanced Querying (HQL & Criteria API) (CO1, CO3)

Rubric: Use of Hibernate Query Language (HQL) and JPA Criteria API. **Implementation:** Type-safe database searches and optimized aggregations.

HQL (Hibernate Query Language)

```
// File: src/main/java/com/treeplantation/dao/VolunteerDAO.java
public List<Volunteer> findVolunteersByEmailDomain(String domain) {
    Session session = sessionFactory.getCurrentSession();
    // Using named parameters in HQL
    Query<Volunteer> query = session.createQuery(
        "FROM Volunteer v WHERE v.email LIKE :domain", Volunteer.class);
    query.setParameter("domain", "%" + domain);
    return query.getResultList();
}
```

JPA Criteria API

```
// File: src/main/java/com/treeplantation/dao/PlantationDriveDAO.java
public List<PlantationDrive> findDrivesByLocationPattern(String pattern) {
    Session session = sessionFactory.getCurrentSession();
    CriteriaBuilder cb = session.getCriteriaBuilder();
```

```
    CriteriaQuery<PlantationDrive> cr = cb.createQuery(PlantationDrive.class);
    Root<PlantationDrive> root = cr.from(PlantationDrive.class);

    // Type-safe dynamic query
    cr.select(root).where(cb.like(root.get("location"), "%" + pattern + "%"));
    return session.createQuery(cr).getResultList();
}
```

---

6. SDG Integration (CO4 / SDG)

Rubric: Implementation of Sustainable Development Goals logic. **Implementation:** JDBC mapping to calculate estimated CO2 offset, actively displayed on the JSF dashboard.

```
// File: src/main/java/com/treeplantation/dao/ReportDAO.java
public int getCo2OffsetEstimate() {
    // 1 Tree absorbs roughly 21kg of CO2 per year
    String sql = "SELECT SUM(quantity) * 21 AS co2_offset FROM drive_trees";
    Session session = sessionFactory.getCurrentSession();

    return session.doReturningWork(connection -> {
        try (PreparedStatement stmt = connection.prepareStatement(sql);
             ResultSet rs = stmt.executeQuery()) {
            if (rs.next()) {
                return rs.getInt("co2_offset");
            }
            return 0;
        }
    });
}
```

```
<!-- File: src/main/webapp/reports.xhtml -->
<div class="stat-card">
    <h3>CO₂ Offset Estimate</h3>
    <div class="stat-value text-green">
        #{reportController.co2OffsetEstimate} kg/yr
    </div>
    <div class="stat-badge">SDG 13 &amp; 15 🌍</div>
</div>
```
